

Tenderfish MVP Scope Lock

Developer document. This document locks the Phase 1 scope and defines the end point of the first build.

Scope rule

The MVP ends at a formally releasable tender package.

Phase split

Phase 1 covers project structuring, cost preparation, and tender preparation. Phase 2 begins with active tender participation, award, and execution collaboration.

1. Purpose of this document

This document does not redefine Tenderfish. It narrows the first build to a clear and realistic end point. The MVP should stop at the point where an architect or project lead can formally release a tender package.

2. Product split

- Phase 1: from messy project input to a tender-ready project package
- Phase 2: from tender participation to awarded project execution

The first product version is therefore not a full lifecycle construction platform yet. It is an intelligent project structuring, cost preparation, and tender preparation system.

3. MVP end state

The MVP is complete when Tenderfish can take unstructured project input and produce a structured, reviewable, approvable, and tender-ready project package strong enough for formal release.

4. Phase 1 outcomes

4.1 Structured Project Description

Tenderfish must convert briefings, emails, drawings, spreadsheets, PDFs, notes, images, and conversations into a structured project description. This description is not just a text summary. It is a defined and approved project state.

- project name
- project goal
- project type
- location
- participants
- scope of work
- spatial scope
- relevant approved documents
- assumptions
- open points
- current project phase

- approved project resources
- current defined project status

Important rule: only real and project-relevant versions should become part of the approved project state. Internal working fragments, informal drafts, or temporary thinking states should not automatically become project truth.

4.2 Cost Estimate

The second major outcome is a cost estimate based on the structured and approved project state. Cost logic should be derived from approved project description, approved project resources, defined rules and standards, and confirmed project structure. It should not be derived from random unreviewed raw material alone.

4.3 Detailed Planning and Packaging Logic

The third outcome is a more detailed planning state that supports tender preparation.

- clearer descriptions
- work package structure
- cost group structure
- item or package logic
- relevant supporting documents
- links between scope, cost, and package definition

This is the layer where the project becomes ready for formal tender preparation.

4.4 Tender-Ready Release State

The final outcome of Phase 1 is a formally releasable tender package. The system must support a state where the project has been sufficiently structured, the relevant documents are approved, the cost estimate exists, the tender logic is prepared, packages are defined, and the responsible person can actively release the tender state. This release action must be explicit and auditable.

5. What belongs in Phase 1

- conversational project intake
- file upload and mixed input handling
- project email intake
- structured inbox
- structured project description
- project versions
- approved resource logic
- cost estimate logic
- planning and packaging logic
- tender readiness logic
- approval and release actions
- participant inference and confirmation

- dashboard with readiness and next actions
- exportable tender-relevant project outputs

6. What does not need to be fully built in Phase 1

- full execution workflows
- daily construction site documentation
- full contractor collaboration environment
- post-award reporting loops
- full change order execution workflows in real delivery
- ongoing builder or general contractor operations
- complete site-level mobile operational layer

These may be prepared architecturally, but they are not part of the MVP completion criteria.

7. Phase 2 start point

Phase 2 begins once the tender process becomes collaborative and external execution actors enter the system in an active and binding way.

- inviting bidders
- receiving tender participation
- collecting offers
- making award decisions
- inviting the awarded contractor or builder into the project
- making platform participation mandatory for the awarded execution partner
- starting execution documentation, progress reporting, and operational collaboration

8. User and access logic across phases

Before tender release, not every participant needs an account. Many contributors may remain external sources. Roles may be inferred and confirmed, and lightweight participation is acceptable.

After award, the awarded contractor or execution partner must create a real account, become a formal active project participant, work inside the system as part of the execution environment, and submit status, documents, progress, and other required project information through Tenderfish.

9. MVP governance rules

- The MVP ends at tender release, not at execution delivery.
- The approved project state must be based only on relevant and approved resources.
- The structured project description is a first-class outcome.
- The cost estimate must be based on the approved project state.
- Tender readiness must be explicit, measurable, and reviewable.
- Tender release must require a clear human approval action.
- Execution collaboration with contractors becomes binding only in Phase 2.

10. What still needs to be specified inside this locked scope

10.1 Mandatory content of the structured project description

Exactly which fields, documents, and approved elements are required.

10.2 Tender readiness rules

Exactly what minimum conditions must be met before release is allowed.

10.3 First-class Phase 1 objects

Exactly which objects are core in the MVP, for example Project, Project Version, Document, Approved Resource, Cost Group, Cost Item, Package, Participant, Approval, and Tender Release State.

11. Final internal definition

Tenderfish Phase 1 is an intelligent project structuring and tender preparation system that transforms messy project input into an approved project description, a cost estimate, a detailed tender structure, and a formally releasable tender package.
